

Dating Application

Technology & Architecture Proposal

A modern, safety-first dating platform for Malaysia, the Maldives & India — *built for meaningful connections, not another swipe clone.*

Executive summary

The objective

Develop a modern dating application focused on meaningful connections, profile authenticity, smart matching and user safety — with its own branding, UI/UX and product identity.

The approach

Rather than competing head-on with Tinder or Bumble, the product targets a distinct niche / community. It is delivered in disciplined phases — a tested MVP first, then premium, communication and AI capabilities.

Safety, verification and matching quality are the product's differentiators.

3

target markets — phased rollout

13

mobile feature modules

6

delivery phases (0 – 5)

20–28

weeks — planning estimate

Eight principles the product is built on

Meaningful connections

Profile authenticity

Smart matching

Location-based discovery

Secure communication

User safety

Premium features

Future AI capabilities

Its own branding, UI/UX and product identity — not a direct visual or functional copy of Tinder or Bumble.

A distinct identity — and a focused market

Product identity

The product carves out its own space:

- Not a direct visual or functional copy of Tinder / Bumble
- Its own branding, UI/UX and product identity
- Focus on a distinct niche / community — not competing head-on with large platforms
- Differentiation through safety, verification and matching quality

Target market

Malaysia

Launch market

Maldives

Next

India

Next

Phased rollout — Malaysia first, then the Maldives and India.

Thirteen mobile feature modules

Feature-first structure — each module owns its presentation, domain and data layers.

Proven, production-grade components

Component	Technology
Mobile	Flutter
Backend	Laravel 12
Language	PHP 8.3+
Database	PostgreSQL
Cache	Redis
API	REST API
Authentication	Laravel Sanctum + OAuth
Real-time	Laravel Reverb / WebSockets
Media	S3-compatible storage
Push	Firebase Cloud Messaging

Component	Technology
AI	OpenAI API
Voice / Video	WebRTC / Agora
Maps	Google Maps / Mapbox
Admin	Laravel + Filament
Containers	Docker
Version control	GitHub
CI / CD	GitHub Actions
Monitoring	Sentry
Web server	Nginx

How the pieces fit together

Feature-first + Clean Architecture

lib/ module layout

- core/
- authentication/
- onboarding/
- profile/
- discovery/
- matching/
- chat/
- notifications/
- subscriptions/
- verification/
- calls/
- safety/
- settings/

Each feature is self-contained

Feature-first + Clean Architecture keeps modules independently testable and shippable phase by phase.

Sign-in options and account controls

Required — client core features

- Email login
- Phone number login
- OTP verification
- Google login
- Apple login

Additional — proposed

- Logout
- Forgot password
- Account deletion
- Session management
- Device management

Email, phone, OTP, Google and Apple sign-in are explicitly requested in the client's core features.

What every member can create and edit

A basic profile engine: photos, short bio, and preferences such as age, distance and hobbies.

A dedicated prompt system for personality

How it works

- Curated library of prompts, organised by category
- Members select and answer multiple prompts
- Answers shown on the profile and re-orderable

profile_prompts

id • prompt • category
is_active • sort_order
created_at • updated_at

Example prompts

- "I feel most like myself when..."
- "My ideal first date is..."
- "A green flag I look for is..."
- "My perfect weekend is..."

user_profile_prompts

id • user_id • prompt_id
answer • sort_order
created_at • updated_at

A curated prompt library plus each member's answers — two lightweight tables.

The main swipe experience

Initial filters

- Age
- Distance
- Interests
- Relationship goals

Advanced filters

- Religion
- Politics
- Additional preferences

Religion and politics are explicit advanced-filter requirements.

Location drives discovery — privately

Never exposed

- Exact coordinates
- Exact address
- Raw GPS data

Shown instead

"4 km away"

Approximate distance only — enough to prioritise nearby matches within the chosen radius.

Compatibility from behaviour and intent

Core interactions and proposed extras

CORE — MVP

Proposed premium / engagement features: **Super Like** · **Rewind**

Treated as proposed premium features — not mandatory MVP unless the client approves them.

Low-latency messaging once users match

Real-time text chat

Message history

Read receipts

Typing indicator

Online / offline status

Push notifications

Media communication — confirm as MVP or Phase 2: voice notes · GIFs · photo sharing

Communication gated to subscribers

Unmatched messaging

- Messaging an unmatched user is restricted to subscription users
- Enforced on the backend — not just hidden in the app UI

Voice & video calling

- Subscriber-only feature
- Provider: WebRTC, Agora or another approved option

Mandatory protection for every member

Proposed report categories

 Harassment

 Fake profile

 Spam

 Inappropriate content

 Scam

 Other

Reducing catfishing with AI photo checks

An AI photo / selfie check confirms a member is real — reducing catfishing before a Verified badge is granted.

The exact verification provider and methodology — AI, manual review or ID verification — are confirmed with the client before implementation.

Free access, with premium upgrades

Free

- Profile creation
- Discovery
- Basic filters
- Like / pass
- Matching
- Basic messaging

Premium

- Unlimited likes
- Advanced filters
- Profile boost
- Message unmatched users
- Voice calling
- Video calling

Number of plans, pricing and exact entitlements are confirmed by the client.

Light mechanics that drive engagement

Profile prompts

Badges

Swipe mechanics

Profile completion

Engagement achievements

Badges, prompts and swipe mechanics are called out in the client's requirements as engagement mechanisms.

Keeping members informed in real time

Operations, moderation and revenue in one place

Dashboard

- Total & active users
- New users, matches, messages
- Reports, premium users, revenue

User management

- Search & view users
- Suspend, ban, delete
- Account history

Moderation

- Reports queue
- Verification review
- Suspicious accounts & content

Subscription

- Plans & pricing
- Subscriber list & status
- Payments

Core schema, grouped by domain

Future AI tables: ai_profile_analysis · compatibility_scores · recommendation_history

One consistent REST surface

Endpoints — /api/v1

/auth	/users	/profiles	/interests	/prompts
/discovery	/swipes	/matches	/chat	/notifications
/subscriptions	/payments	/verification	/calls	/safety

Every endpoint applies: authentication · authorization · request validation · API resources · rate limiting · consistent error responses

Six phases, each tested before the next

Indicative per-phase effort — see the next slide for the full breakdown.

An initial planning estimate

Phase	Estimated duration
Requirements + UI/UX	2–3 weeks
Architecture + Database	1–2 weeks
MVP development	6–8 weeks
Premium features	3–4 weeks
Communication / calls	2–3 weeks
AI features	3–4 weeks
Testing & security	2–3 weeks
Deployment	1 week

20–28

weeks total, end to end

Not a fixed commitment

Final duration is set after the client confirms scope, UI/UX, integrations and subscription requirements.

Client decisions required

■ PRODUCT

1. Exact target niche / community
2. Brand name
3. Countries for initial launch
4. Age restrictions
5. Relationship categories

■ MATCHING

6. Gender options
7. Age range
8. Distance range
9. Matching criteria
10. Advanced filters

■ PREMIUM

11. Number of subscription plans
12. Pricing
13. Premium benefits
14. Boost system
15. Unmatched-messaging rules

■ COMMUNICATION

16. Voice notes?
17. GIFs?
18. Photo sharing?
19. Voice calls?
20. Video calls?

■ VERIFICATION

21. AI verification?
22. Manual verification?
23. ID verification?

■ AI

24. AI compatibility score?
25. AI icebreakers?
26. AI profile assistance?

■ BUSINESS

27. Payment gateway
28. Store subscription strategy
29. Admin users
30. Launch date

30 items in total — grouped for a single sign-off session.
